USAEE releases Accident Investigation Board Report

The pilot, assigned to the 493rd Fighter Squadron, was fatally injured.

“This unfortunate accident is yet another reminder of the inherent risks Airmen take on a daily basis to ensure the successes of our Air Force,” said Gen. Jeff Harrigian, USAFE-AFAFRICA commander. “Lt. Allen was an outstanding officer and a tremendous asset to the team. No words can compensate for such a painful and sudden loss.”

“The loss of an Airman is never easy, and this aircraft accident was no exception,” said Col. Jason Camilletti, 48th Fighter Wing commander. “Our Liberty Wing community, especially the Reapers of the 493rd Fighter Squadron, was truly touched by the tremendous outpouring of support from families, friends and partners around the globe in our time of grieving.”

The mishap occurred during a routine local combat training flight.

The AIB found, by a preponderance of evidence, that the cause of the mishap was the pilot’s fixation on the intercept of the simulated adversary aircraft and failure to execute cockpit instrument visual scans when the pilot encountered Instrument Meteorological Conditions. Reduced visibility and a lack of a discernable horizon for the pilot resulted in spatial disorientation. The inability of the pilot to accurately sense the pitch attitude of the aircraft due to spatial disorientation significantly contributed to the pilot’s undesirable low pitch attitude, rapidly descending altitude, and the resulting mishap.

The Air Force is constantly evaluating its procedures with regard to safety and ensures these findings are incorporated into flying training programs and curriculum.

The aircraft, valued at approximately $45 million, was destroyed.
